@thorsadoptedbro

Pitch

What is dragd?

Dragd is a no-code website builder for .sol addresses which can be deployed on IPFS.

dragd

Why?

There is no easy way to deploy sites to .sol addresses. Most .sol addresses have no utility today.

dragd

Centralised web vs Decentralised Web

1.7B+ websites

Centralised Hosting

2K websites

**Decentralised Hosting**

dragd

Vision

To increase crypto/web3 adoptions amongst non-tech users, it's important to allow them to interact with the ecosystem with simplicity and utilise their domains to showcase their identity, work and more on the decentralised web

dragd

How does it work?

The site built using the drag and drop builder publishes to IPFS and updates the hash of the site to the metadata to the .sol address.
